

The Connection Between the PICO, PEO, and PCO Frameworks and Editing Style in Scientific Writing

Name: Muhamad Ihsan Ramadhan

Course: Research Paper Writing

Assignment: Assignment 2 (Framework Analysis and Editing Style)

1. Introduction

The Systematic Literature Review (SLR) method demands a very high level of rigor, not only in data retrieval but also in how that data is presented. The most fundamental initial step is formulating a clear research question. To achieve this, researchers use various frameworks such as PICO, PEO, and PCO. However, an often overlooked understanding is how the choice of these frameworks directly dictates the editing style of academic manuscripts. The relationship between framework and editing style is key to ensuring that the results of a literature review are not only scientifically accurate but also communicative and consistent.

2. Framework Analysis: PICO, PEO, and PCO

Each framework has features that affect the writing's structure, according to the content covered in Week 4:

PICO: Population, Comparison, Intervention, and Outcome used in quantitative or clinical research to evaluate an action's efficacy. The writing is usually very strict and technical.

The population's reaction to environmental exposure or particular circumstances is the main focus of PEO (Population, Exposure, Outcome). The observable cause-and-effect linkages are highlighted in the writing style.

In qualitative investigations where the environment or social background (context) is a crucial element, PCO (Population, Context, Outcome) is utilized. The writing is far more narrative and descriptive.

3. The Connection Between Frameworks and Editing Style

Editing scientific manuscripts is not just about correcting grammar, but also ensuring that the logic of the framework used shines through in every paragraph. Here are the key points of connection:

A. **Terminology Consistency:** Editors have to make sure that the framework's components are maintained throughout the editing process, from the title to the end. The terms "Intervention" and "Exposure" should not be used interchangeably in a PICO study. The usage of terms found using Boolean operators (such AND, OR) as narrative anchors should be guaranteed by the editing style. This makes it clearer to readers that the work stays true to the original study question.

B. Narrative Structure and Clarity: The PICO framework demands a to-the-point, data-driven editing style. Conversely, when editing a PCO-based manuscript, editors should allow for richer descriptions of the context. Editing style ensures that the explanation of the context does not become too wordy but still provides readers with a clear picture of the situation being studied.

C. Methodological Transparency: SLR editing should take transparency into account. In order for readers to follow the researcher's procedures, the literature search documentation, the inclusion and exclusion criteria, and the reasoning behind the article selection must be revised. It is important to utilize descriptive and objective language to show that every choice was made following a rigorous methodology rather than the subjectivity of the researcher.

4. Implementation in Writing the Results and Discussion Sections

This relationship becomes even more evident in the discussion section. Researchers using PICO will edit their discussion section with a focus on comparing results between studies. Their editing style will heavily utilize comparative sentences. Meanwhile, researchers using PEO or PCO will edit their discussion by linking the results back to the population situation or social context, resulting in a more interpretive and in-depth editing style.

5. Conclusion

It can be concluded that PICO, PEO, and PCO are not simply tools for searching journal databases. They are the architecture of the entire paper. Editing style serves as a binding force that ensures this architecture is robust and easy to understand. Without an editing style that aligns with the chosen framework, an SLR article will lack the power to convey its argument. Therefore, a researcher must understand from the outset that their choice of framework will determine how every word and sentence in the document will be structured and edited.
